Reflection 5

This class is my first introduction to some of the seemingly lesser known coding languages which includes scheme, javascript, css, and html. Being taught Java for three semesters in a row and being forced to code in C++ and python for only a class respectively coding seemed very black and white to me. For me the other difference between those three are the syntax and the overall feel and theme of it feels similar. Javascript and HTML for me seems like the most interesting and newest experience for me. Rather than creating code and compiling and testing it to see if it is functional or not before submitting an assignment I get to see my code come to life on a website. As I work step by step on my JS assignment I can see where I can type in my input and just have a live interaction as I continue on the code rather than having to manually compile and test each block of code for my other assignments. Additionally with CSS being able to mess around with the aesthetics of my program proved to be a fun and enjoyable experience. Scheme altho confusing was rather interesting to take in especially the syntax. I also worked a bit with manipulating data with SQL. Creating tables and inputting data into my tables was an interesting experience. Outside of class I was able to take advantage of my small knowledge of SQL and was able to store and organize data in my table for my games.
